INTEGRATED CIRCUITS

Preliminary specification File under Integrated Circuits, IC02 July 1994

HILIP

### TDA9800

#### FEATURES

- Suitable for negative vision modulation
- Applicable for IF frequencies of 38.9 MHz, 45.75 MHz and 58.75 MHz
- Gain controlled wide band VIF amplifier (AC coupled)
- True synchronous demodulation with active carrier regeneration (ultra-linear demodulation, good intermodulation figures, reduced harmonics and excellent pulse response)
- Peak sync AGC for negative modulation
- · Video amplifier to match sound trap and sound filter

- AGC output voltage for tuner; adjustable take-over point (TOP)
- AFC detector without extra reference circuit
- Alignment-free FM-PLL detector with high linearity
- Stabilizer circuit for ripple rejection and to achieve constant output signals
- 5 to 8 V positive supply voltage range, low power consumption (300 mW at +5 V supply voltage).

#### **GENERAL DESCRIPTION**

The TDA9800 is a monolithic integrated circuit for vision and sound IF signal processing in TV and VTR sets.

#### QUICK REFERENCE DATA

| SYMBOL                | PARAMETER  | MIN. | TYP. | MAX. | UNIT |
|-----------------------|--|------|------|------|------|
| V <sub>P</sub>        | positive supply voltage (pin 20)                             | 4.5  | 5    | 8.8  | V    |
| l <sub>P</sub>        | supply current   | 51   | 60   | 69   | mA   |

### TDA9800

#### FUNCTIONAL DESCRIPTION

#### **Vision IF input**

The vision IF amplifier consists of three AC-coupled differential amplifier stages; each stage comprises a controlled feedback network by means of emitter degeneration.

#### IF and tuner AGC

The automatic control voltage to maintain the video output signal at a constant level is generated according to the transmission standard. Since the TDA9800 is suitable for negative modulation only the peak-sync level is detected. The AGC detector charges and discharges the capacitor on pin 19 to set the IF gain and the tuner gain. The AGC capacitor voltage is transferred to an internal IF control signal, and is fed to the tuner AGC to generate the tuner AGC output current on pin 12 (open-collector output). The tuner AGC voltage take over point is adjusted on pin 3. This allows the tuner and the IF SAW filter to be matched to achieve the optimum IF input level.

# Frequency detector, phase detector and video demodulator

The IF amplifier output signal is fed to a frequency detector and to a phase detector. During acquisition the frequency detector produces a DC current which is proportional to the frequency difference between the input and the VCO signal. After frequency lock-in the phase detector produces a DC current proportional to the phase difference between the VCO and the input signal. Via the loop filter the DC current of either frequency detector or phase detector is converted into a DC voltage, which controls the VCO frequency.

The video demodulator is a linear multiplier, designed for low distortion and wide bandwidth. The vision IF input signal is multiplied by the in-phase component of the VCO output. The demodulated output signal is fed via an integrated low-pass filter ( $f_g = 12$  MHz) to the video amplifier for suppression of the carrier harmonics.

#### VCO and travelling wave divider

The VCO operates with a symmetrically-connected reference LC-circuit, operating at double vision carrier frequency. Frequency control is performed by an internal varicap diode. The voltage to set the VCO frequency to the actual frequency of double vision carrier frequency, is also amplified and converted for the AFC output current. The VCO signal is divided-by-two in a travelling wave divider, which generates two differential output signals with 90 degree phase difference independent of frequency.

#### Video amplifier, buffer and noise clipping

The video amplifier is a wide bandwidth operational amplifier with internal feedback. A nominal positive modulated video signal of 1 V (p-p) is present on the composite video output (pin 13). The input impedance of the 7 dB wideband buffer amplifier (with internal feedback) is suitable for ceramic sound trap filters. The CVBS output (pin 7) provides a positive video signal of 2 V (p-p). Noise clipping is provided internally.

#### Sound demodulation

The FM sound intercarrier signal is fed to pin 11 and through a limiter amplifier before it is demodulated. This achieves high sensitivity and high AM suppression. The limiter amplifier consists of seven internal AC-coupled stages, minimizing the DC offset.

The FM-PLL demodulator consists of an RC-oscillator, loop filter and phase detector. The oscillator frequency is locked on the FM intercarrier signal from the limiter amplifier. As a result of this locking, the RC-oscillator is frequency-modulated.

The modulating signal voltage (AF signal) is used to control the oscillator frequency. By this, the FM-PLL operates as an FM demodulator.

The audio frequency amplifier with internal feedback is designed for high gain and high common mode rejection. The low-level AF signal output from the FM-PLL demodulator is amplified and buffered in a low-ohmic audio signal output stage (pin 9). An external decoupling capacitor on pin 10 removes the DC voltage from the audio amplifier input.

By using the sound mute switch (pin 5) the AF amplifier is set to mute state.

### TDA9800

#### LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC134).

| SYMBOL             | PARAMETER   |     | MAX.           | UNIT |
|--------------------|---|-----|----------------|------|
| V <sub>P</sub>     | supply voltage (pin 20) for a maximum chip temperature (note 1) |     |                |      |
|                    | SOT146 at +120 °C   | 0   | 8.8            | V    |
|                    | SOT163A at +100 °C  | 0   | 5.5            | V    |
| VI                 | voltage on pins 1, 2, 7, 11, 13, 14, 15 and 19                  | 0   | V <sub>P</sub> | V    |
| t <sub>s max</sub> | short-circuit time  | _   | 10             | S    |
| V <sub>12</sub>    | tuner AGC output voltage  | -   | 13.2           | V    |
| T <sub>stg</sub>   | storage temperature range                                       | -25 | +150           | °C   |
| V <sub>ESD</sub>   | electrostatic handling for all pins (note 2)                    | -   | ±300           | V    |

#### Notes

1. Supply current I<sub>P</sub> = 69 mA at T<sub>amb</sub> = +70 °C.

2. Equivalent to discharging a 200 pF capacitor through a 0  $\Omega$  series resistor (negative and positive voltage).

#### THERMAL RESISTANCE

| SYMBOL              | PARAMETER                            | THERMAL RESISTANCE |
|---------------------|--------------------------------------|--------------------|
| R <sub>th j-a</sub> | from junction to ambient in free air |                    |
|                     | SOT146                               | 73 K/W             |
|                     | SOT163A                              | 85 K/W             |

### TDA9800

#### CHARACTERISTICS

The following characteristics apply for  $V_P = 5 \text{ V}$ ;  $T_{amb} = +25 \text{ °C}$ ; see Table 1 for input frequencies and picture to sound ratios;  $V_{iIF} = 10 \text{ mV RMS}$  value (sync level); video modulation DSB; residual carrier: 10%; video signal in accordance with CCIR line 17 or NTC-7 Composite; measurements taken in Fig.3 unless otherwise specified

### TDA9800

#### Notes

- 1. Values of video and sound parameters are decreased at  $V_P$  = 4.5 V.
- 2. Loop bandwidth BL = 60 kHz (natural frequency  $f_n = 15$  kHz; damping factor d = 2 calculated with grey level and FPLL input signal level). Resonance circuit of VCO:  $Q_o > 50$ ;  $C_{ext} = 8.2$  pF;  $C_{int} \approx 8.5$  pF (loop voltage about 2.7 V).
- 3. Temperature coefficient of external LC-circuit is equal to zero.
- V<sub>i IF</sub> = 10 mV (RMS value); ∆f = 1 MHz (VCO frequency offset related to picture carrier frequency); white picture video modulation.
- 5. V<sub>i IF</sub> signal for nominal video signal.
- Transformer at IF input (Fig.3). The C/N ratio at IF input for 'lock-in' is defined as the vision IF input signal (sync level, RMS value) in relation to a superimposed, 5 MHz band-limited white noise signal (RMS value); video modulation: white picture.
- Offset current measured between pin 6 and half of supply voltage (V = 2.5 V) under the following conditions: no input signal at IF input (pins 1 and 2) and IF amplifier gain at minimum (V<sub>19</sub> = V<sub>P</sub>), pin 4 (phase adjust) open-circuit.
- 8. The intercarrier output signal is superimposed to the video signal at pin 13 and can be calculated by the following

formula: 20 log
$$\left(\frac{V_{13 \text{ interc.}} (p-p)}{1V (p-p)}\right) = \frac{V_{iSC}}{V_{iPC}} dB + 6.9 dB \pm 2 dB \text{ with } \frac{V_{iSC}}{V_{iPC}} dB = \text{sound to picture carrier ratio at IF}$$

input (pins 1 and 2 in dB and  $\pm 2$  dB = tolerance of intercarrier output amplitude V<sub>o FM</sub>.

- 9. Measurements taken with SAW filter G1962; modulation: VSB, f<sub>video</sub> > 0.5 MHz, loop bandwidth BL = 60 kHz.
- 10. The 7 dB buffer gain accounts for 1 dB loss in the sound trap. Buffer output signal is typical 2 V (p-p). If no sound trap is applied a 330  $\Omega$  resistor must be connected from output to input (from pin 13 to pin 14).
- 11. The leakage current of the AGC capacitor has to be < 1  $\mu$ A to avoid larger tilt.
- 12. S/N is the ratio of black-to-white amplitude to the black level noise voltage (RMS value, pin 7). B = 5 MHz weighted in accordance with CCIR-567 at a source impedance of 50  $\Omega$ .
- 13.  $\alpha_{0.92/1.1} = 20 \log (V_o \text{ at } 4.4 (3.58) \text{ MHz} / V_o \text{ at } 0.92 (1.1) \text{ MHz}) + 3.6 \text{ dB}; \alpha_{0.92/1.1} \text{ value at } 0.92 (1.1) \text{ MHz} \text{ related to black/white signal.}$  $\alpha_{2.76/3.3} = 20 \log (V_o \text{ at } 4.4 (3.58) \text{ MHz} / V_o \text{ at } 2.76 (3.3) \text{ MHz}); \alpha_{2.76/3.3} \text{ value at } 2.76 (3.3) \text{ MHz} \text{ related to colour}$

carrier.

- 14. To match the AFC output signal to different tuning systems a current source output is provided (Fig.8).
- 15. Depending on the ratio  $\Delta C/C_o$  of the LC resonance circuit of VCO ( $Q_o > 50$ ;  $C_o = C_{int} + C_{ext}$ ;  $C_{ext} = 8.2 \text{ pF}$ ;  $C_{int} \approx 8.5 \text{ pF}$ ).
- 16. No mute state is also valid for pin not connected.
- 17. Input level for second IF from an external generator with 50  $\Omega$  source impedance, AC coupled with 10 nF capacitor,  $f_{mod} = 1$  kHz, 27 kHz (54% FM deviation) of audio reference. A VIF/SIF input signal is not permitted. Pin 19 has to be connected to positive supply voltage. S/N and THD measurements are taken at 50  $\mu$ s (75  $\mu$ s at standard M) de-emphasis.
- 18. To allow higher frequency deviation, the resistor  $R_x$  on pin 10 (see Fig.12) has to be increased to a value which does not exceed the AF output signal of nominally 0.35 V for THD = 0.1% ( $R_x = 4.7 \text{ k}\Omega$  provides –6 dB amplification).
- 19. The leakage current of the 2.2  $\mu$ F capacitor is < 100 nA.
- 20. For all S/N measurements the used vision IF modulator has to meet the following specification:
  - Incidental phase modulation for black-to-white jump less than 0.5 degree.

### TDA9800

#### SOLDERING

#### Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"IC Package Databook"* (order code 9398 652 90011).

#### DIP

#### SOLDERING BY DIPPING OR BY WAVE

The maximum permissible temperature of the solder is 260 °C; solder at this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ( $T_{stg\,max}$ ). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

#### REPAIRING SOLDERED JOINTS

Apply a low voltage soldering iron (less than 24 V) to the lead(s) of the package, below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than 300 °C it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and 400 °C, contact may be up to 5 seconds.

#### SO

#### **REFLOW SOLDERING**

Reflow soldering techniques are suitable for all SO packages.

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement. Several techniques exist for reflowing; for example, thermal conduction by heated belt. Dwell times vary between 50 and 300 seconds depending on heating method. Typical reflow temperatures range from 215 to 250 °C.

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 minutes at 45  $^{\circ}$ C.

#### WAVE SOLDERING

Wave soldering techniques can be used for all SO packages if the following conditions are observed:

- A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.
- The longitudinal axis of the package footprint must be parallel to the solder flow.
- The package footprint must incorporate solder thieves at the downstream end.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder is 10 seconds, if cooled to less than 150 °C within 6 seconds. Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

#### REPAIRING SOLDERED JOINTS

Fix the component by first soldering two diagonallyopposite end leads. Use only a low voltage soldering iron (less than 24 V) applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C. When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.
