NPN Silicon RF Transistor

- For highest gain low noise amplifier at 1.8 GHz and 2 mA / 2 V
  **Outstanding** $G_{ms} = 23$ dB
  **Noise Figure** $F = 0.95$ dB
- For oscillators up to 15 GHz
- Transition frequency $f_T = 45$ GHz
- Gold metallization for high reliability
- **SIEGET® 45 - Line**
  - 45 GHz $f_T$ - Line

**ESD:** Electrostatic discharge sensitive device, observe handling precaution!

Valid up to 6GHz

The SOT-343 package has two emitter leads. To avoid high complexity of the package equivalent circuit, both leads are combined in one electrical connection.

For examples and ready to use parameters please contact your local Infineon Technologies distributor or sales office to obtain a Infineon Technologies CD-ROM or see Internet:
For non-linear simulation:

- Use transistor chip parameters in Berkeley SPICE 2G.6 syntax for all simulators.

- Simulation of the package is not necessary for frequencies < 100MHz. For higher frequencies please add the wiring of the package equivalent circuit around the non-linear transistor.

Advantages of the common emitter configuration:

- Higher gain because of lower emitter inductance.
- Power is dissipated via the grounded emitter leads, because the chip is mounted on the copper emitter leadframe.

Please note, that the broadest lead is the emitter lead.
