HCF4067B

ANALOG SINGLE 16 CHANNEL MULTIPLEXER/DEMULTIPLEXER

- LOW ON RESISTANCE : 125Ω (Typ.) OVER 15V p-p SIGNAL INPUT RANGE FOR VDD - VSS = 15V
- HIGH OFF RESISTANCE : CHANNEL LEAKAGE OF 10pA (Typ.) at VDD - VSS = 10V
- MATCHED SWITCH CHARACTERISTICS : ΔRON = 5Ω (Typ.) FOR VDD - VSS =15V
- VERY LOW QUIESCENT POWER DISSIPATION UNDER A DIGITAL CONTROL INPUT AND SUPPLY CONDITIONS : 0.2µW (Typ.) at VDD - VSS = 10V
- BINARY ADDRESS DECODING ON CHIP
- QUIESCENT CURRENT SPECIFIED UP TO 20V
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- 5V, 10V AND 15V PARAMETRIC RATINGS
- INPUT LEAKAGE CURRENT Ii = 100nA (MAX) AT VDD = 18V T A = 25°C
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC JESD13B "STANDARD SPECIFICATIONS FOR DESCRIPTION OF B SERIES CMOS DEVICES"

DESCRIPTION
HCF4067B is monolithic integrated circuits fabricated in Metal Oxide Semiconductor technology available in SOP package.

HCF4067B, analog multiplexer/demultiplexer CMOS, is a digitally controlled analog switches device having low ON impedance, low OFF leakage current and internal address decoding. In addition, the ON resistance is relatively constant over the full input-signal range. HCF4067B ia a 16-channel multiplexer with four binary control inputs A, B, C, D, and an inhibit input, arranged so that any combination of the inputs selects one switch.

\(^\star\) Typical temperature coefficient for all \(V_{DD}\) value is 0.3 %/°C

\(^\star\star\) : Both Ends of Channel

\(^\star\) : Peak to Peak voltage symmetrical about \((V_{DD} - V_{SS})/2\)
APPLICATION INFORMATION

In applications where separate power sources are used to drive \( V_{DD} \) and the signal inputs, the \( V_{DD} \) current capability should exceed \( V_{DD}/R_L \) (\( R_L \) = effective external load). This provision avoids permanent current flow or clamp action on the \( V_{DD} \) supply when power is applied or removed from the HCF4067B.

When switching from one address to another, some of the ON periods of the channels of the multiplexers will overlap momentarily, which may be objectionable in certain applications. Also, when a channel is turned ON or OFF by an address input, there is a momentary conductive path from the channel to \( V_{SS} \), which will dump some charge from any capacitor connected to the input or output of the channel. The inhibit input turning on a channel will similarly dump some charge to \( V_{SS} \).

The amount of charge dumped is mostly a function of the signal level above \( V_{SS} \). Typically, at \( V_{DD} - V_{SS} = 10 \text{V} \), a 100 pF capacitor connected to the input or output of the channel will lose 3-4% of its voltage at the moment the channel turns ON or OFF. This loss of voltage is essentially independent of the address or inhibit signal transition time, if the transition time is less than 1-2 ms. When the inhibit signal turns a channel off, there is no change dumping of \( V_{SS} \). Rather, there is a slight rise in the channel voltage level (65 mV typ.) due to the capacitance coupling from inhibit input to channel input or output. Address input also couple some voltage steps onto the channel signal levels.

In certain applications, the external load-resistor current may include both \( V_{DD} \) and signal line components. To avoid drawing \( V_{DD} \) current when switch current flows into the transmission gate inputs, the voltage drop across the bidirectional switch must not exceed 0.8V (calculated from \( R_{ON} \) values shown in ELECTRICAL CHARACTERISTICS CHART). No \( V_{DD} \) current will flow through \( R_L \) if the switch current flows into terminal 1 on the HCF4067B.

TEST CIRCUIT

\[ C_L = 50 \text{pF or equivalent (includes jig and probe capacitance)} \]
\[ R_L = 200 \Omega \]
\[ R_T = Z_{OUT} \text{ of pulse generator (typically 50\Omega)} \]
