15W BTL×2CH AUDIO POWER AMPLIFIER

The thermal resistance \( \theta_{j-T} \) of KIA6216H package designed for low thermal resistance, has a high efficiency of heat radiation.

The temperature rise of chip can be reduced, and the influence from the degradation of the features due to the temperature rise at the high output can also be reduced.

This stereo audio power IC, designed for car audio use, has two built-in channels to reduce the characteristic difference between L and R channels.

In addition, the functions of stand-by and muting, and a variety of protection circuits are involved.

FEATURES

- Low Thermal Resistance.
  - \( \theta_{j-T}=1.5^\circ C/W \) (Infinite heat sink)
- High Power.
  - \( P_{\text{OUT(1)}}=18W \text{(Typ.)}/\text{Channel} \)
    \( V_{\text{CC}}=14.4\text{V}, f=1\text{kHz}, \text{THD}=10\%, R_L=4\Omega \)
  - \( P_{\text{OUT(2)}}=15W \text{(Typ.)}/\text{Channel} \)
    \( V_{\text{CC}}=13.2\text{V}, f=1\text{kHz}, \text{THD}=10\%, R_L=4\Omega \)
- Low Distortion.
  - \( \text{THD}=0.04\% \text{(Typ.)} \)
    \( V_{\text{CC}}=13.2\text{V}, f=1\text{kHz}, P_{\text{OUT}}=1\text{W}, R_L=4\Omega, G_c=50\text{dB} \)
- Low Noise.
  - \( V_{\text{NOISE}}=0.30mV_{\text{rms}} \text{(Typ.)} \)
    \( V_{\text{CC}}=13.2\text{V}, R_L=4\Omega, G_c=50\text{dB}, R_g=0\Omega, \text{BW}=20\text{Hz} \sim 20\text{kHz} \)
- Built-in stand-by function.
  - (With \( \Phi \) pin set at Low, power is turned OFF.)
    - \( I_{\text{BB}}=1\mu A \text{(Typ.)} \)
- Built-in muting function.
  - (With \( \Phi \) pin set at Low, power is turned OFF.)
    - \( V(\text{Mute})=1\text{V (Typ.)} \)
- Built-in various protection circuits.
  - Thermal shut down, over voltage, OUT→\( V_{\text{CC}} \) short, OUT→GND short and OUT→OUT short.
- Operating supply voltage \( V_{\text{CC}}=9 \sim 18\text{V} \).

CAUTIONS AND APPLICATION METHOD
(Description is made only on the single channel.)

1. Voltage Gain Adjustment

![Circuit Diagram]

Amp 1 : Pre-Amp  Amp 3 : POWER Amp (Flat-Amp)
Amp 2 : Phase Amp  Amp 4 : POWER Amp (Flat-Amp)

(Fig. 1)

This IC has the amplifier construction as shown in Fig. 1. The Pre-Amp (Amp 1) is provided to the primary stage, and the input voltage is amplified by the Flat Amps, Amp 3 and Amp 4 of each channel through the phase Amp (Amp 2).
Since the input offset is prevented by Pre-Amp when Vcc is set to ON, this circuit can remarkably reduce the pop noise.
The total closed loop gain Gv of this IC can be obtained by expression below when the closed loop voltage gain of Amp 1 is Gv1,

\[ G_{V1} = 20 \log \frac{R_1 + (R_2 + R_3)}{R_1 + R_2} \text{ (dB)} \]  

\[ \text{(1)} \]

The closed loop voltage gain of POWER Amp (Amp 3 and 4) is fixed at

\[ G_{V2} = G_{V4} = 20 \text{dB} \]

Therefore the total closed loop voltage Gv is obtained through BTL connection by the expression below.

\[ G_v = G_{V1} + G_{V2} + 6 \text{ (dB)} \]  

\[ \text{(2)} \]

For example, when Rf=0Ω, Gv is obtained by the expression (1) and (2) as shown below.

\[ G_v = 24 + 20 + 6 = 50 \text{dB} \]
The voltage gain is reduced when \( R_f \) is increased. (Fig.2)
With the voltage gain reduced, since (1) the oscillation stability is reduced, and
(2) the pop noise changes when \( V_{cc} \) is set to ON, refer to the items 3 and 4.

![Graph showing voltage gain vs. feedback resistance](image)

**Fig-2.**

2. Stand-by SW Function
   By means of controlling 4 pin (Stand-by terminal) to High and Low, the power supply can be set to ON and OFF.
   The threshold voltage of 4 pin is set about 3V (Typ.), and the power supply current is about 1μA(Typ.) at the stand-by state.

![Circuit diagram](image)

(Fig.3) With 4 Pin set to High, Power is turned ON.

</tr>
</tbody>
</table>

~Advantage of Stand-by SW~
(1) Since Vcc can directly be controlled to ON/OFF by the microcomputer, the switching relay can be omitted.
(2) Since the control current is microscopic, the switching relay of small current capacity is satisfactory for switching.

Large current capacity switch

Small current capacity switch

(Conventional Method)

(Standby Switch Method)
3. Preventive Measure Against Oscillation
   For preventing the oscillation, it is advisable to use C4, the condenser of polyester film
   having small characteristic fluctuation of the temperature and the frequency.
   The resistance R to be series applied to C4 is effective for phase correction of high frequency,
   and improves the oscillation allowance.
   Since the oscillation allowance is varied according to the causes described below, perform the
   temperature test to check the oscillation allowance.

   (1) Voltage gain to be used (Gv Setting)
   (2) Capacity value of condenser
   (3) Kind of condenser
   (4) Layout of printed board

   In case of its use with the voltage gain Gv reduced or with the feedback amount
   increased, care must be taken because the phase-inversion is caused by the high
   frequency resulting in making the oscillation generated.

4. Input Offset Prevention Circuit At Vcc→ON
   Having Pre-Amp (Amp 1) mounted on the primary stage, this IC contains the circuit
   for making the Ampl1 input voltage and the NF terminal voltage equipotential.
   Therefore, the offset voltage produced at the input stage is suppressed to prevent the
   pop noise at Vcc→ON. The capacity values of the input and NF condenser (C1 and C2)
   shall be set according to the gain to be used.
   (Reference)  (A) At Gv=50dB (Rf=0Ω)
                C1=4.7µF,  C2=47µF
   (B) At Gv=40dB (Rf=470Ω)
        C1=3.3µF,  C2=33µF

5. Muting Function
   Through setting ① pin (mute terminal) at about 1V or less, muting becomes possible.
   The interval circuit of IC is shown is Fig. 4.
   When ① pin is set to Low, Q1 and Q2 are turned to ON, the charge of the ripple
   condenser is discharged and the bias is cut. The mute amount of 60dB or over can
   be obtained.
   Since this muting function rapidly discharges the charge of the ripple filter capacitor
   of ⑧ pin, the pop noise is generated by the DC fluctuation of the bias section.
   Therefore, this muting function is not appropriate to the audio muting but is effective
   in muting at Vcc→ON.
