30W BTL DUAL AUDIO POWER AMPLIFIER

The thermal resistance $\theta_{jc}$ of KIA6221AH package CPP-17 (Compact Power Package 17pin), designed for low thermal resistance, has high efficiency of heat radiation. The temperature rise of chip can be reduced, and the influence from the degradation of the features due to the temperature rise at the high output can also be reduced. This stereo audio power IC, designed for car audio use, has two built-in channels to reduce the characteristic difference between L and R channels.

FEATURES

- **Low Thermal Resistance**
  - $\theta_{jc}=1.5^\circ C/W$ (Infinite heat sink)

- **High Power**
  - $P_{\text{OUT}(1)}=30W$(Typ.)/Channel
    - ($V_{CC}=14.4V$, $f=1kHz$, THD=10%, $R_L=2\Omega$)
  - $P_{\text{OUT}(2)}=26W$(Typ.)/Channel
    - ($V_{CC}=13.2V$, $f=1kHz$, THD=10%, $R_L=2\Omega$)
  - $P_{\text{OUT}(3)}=19W$(Typ.)/Channel
    - ($V_{CC}=13.2V$, $f=1kHz$, THD=10%, $R_L=4\Omega$)

- **Low Distortion**
  - THD$=0.04\%$(Typ.) ($V_{CC}=13.2V$, $f=1kHz$, $P_{\text{OUT}}=1W$, $R_L=4\Omega$, $G_V=50\Omega$)

- **Low Noise**
  - $V_{NO}=0.3mV_{\text{rms}}$(Typ.)
    - ($V_{CC}=13.2V$, $R_L=4\Omega$, $G_V=50\Omega$, $R_g=0\Omega$, BW$=20Hz\sim20kHz$)

- **Built-in stand-by function** (With $\bigcirc$ pin set at LOW, Power is turned OFF.)
  - $I_{\text{ST}}=1\mu A$(Typ.)

- **Built-in various protection circuits**
  - Protection circuits: thermal shut down, over voltage, Out$\rightarrow$V_{CC} short.
    - Out$\rightarrow$GND short and OUT$\rightarrow$OUT short.

- **Operating supply voltage**: $V_{CC}=9~18V$

BLOCK DIAGRAM AND TEST CIRCUIT (Gv=50dB)
CAUTIONS AND APPLICATION METHOD
(Description is made only on the single channel.)

1. Voltage Gain Adjustment

This IC has the amplifier construction as shown in Fig. 1. The pre-Amp (Amp 1) is provided to the primary stage, and the input voltage is amplified by the flat Amps. Amp 3 and 4 of each channel through the phase Amp (Amp 2).

Since the input offset is prevented by pre-Amp when Vcc is set to ON, this circuit can remarkably reduce the pop noise.

The total closed loop gain Gv of this IC can be obtained by expression below when the closed loop voltage gain of Amp 1 is Gv 1.

\[ Gv1 = 20 \log \left( \frac{R1 + (Rf+R2)}{Rf-R2} \right) \text{ (dB)} \]  \hspace{1cm} (1)

The closed loop voltage gain of power Amp, Amp 3 and Amp 4 is fixed at Gv3=Gv4=20dB. Therefore, the total closed circuit voltage gain Gv is obtained through BTL connection by the expression below.

\[ Gv = Gv1 + Gv3 + 6 \text{ (dB)} \]  \hspace{1cm} (2)
For example, when \( R_f = 0 \Omega \), \( G_v \) is obtained by the expression (1) and (2) as shown below.

\[
G_v \approx 24 + 20 \times 6 = 50 \text{ (dB)}
\]

The voltage gain is reduced when \( R_f \) is increased. (Fig. 2)

With the voltage gain reduced, since (1) the oscillation stability is reduced, and (2) the pop noise changes when \( V_{cc} \) is set to ON, refer to the items 3 and 4

2. Stand–by SW Function

By means of controlling \( \textcircled{4} \) pin (Stand–by terminal) to High and Low, the power supply can be set to ON and OFF.

The threshold voltage of \( \textcircled{4} \) pin is set at about 3V(Typ.), and the power supply current is about 1\( \mu \text{A} \) (Typ.) at the stand–by state.

Fig. 3 With \( \textcircled{4} \) Pin set to High, Power is turned ON.

</tr>
</tbody>
</table>

Advantage of Stand-by SW
1) Since Vcc can directly be controlled to ON/OFF by the microcomputer, the switching relay can be omitted.
2) Since the control current is microscopic, the switching relay of small current capacity is satisfactory of switching.

Large current capacity switch

Small current capacity switch

(Conventional Method)

(Stand-by Switch Method)
3. Preventive Measure against Oscillation

For preventing the oscillation, it is advisable to use C4, the condenser of polyester film having small characteristic fluctuation of the temperature and the frequency.

The resistance R to be series applied to C4 is effective for phase correction of high frequency, and improves the oscillation allowance.

Since the oscillation allowance is varied according to the causes described below, perform the temperature test to check the oscillation allowance.

(1) Voltage gain to be used (Gv Setting)
(2) Capacity value of condenser
(3) Kind of condenser
(4) Layout of printed board

In case of its use with the voltage gain Gv reduced or with the feedback amount increased, care must be taken because the phase-inversion is caused by the high frequency resulting in making the oscillation liable generated.

4. Input Offset Prevention Circuit At Vcc→ON

Having Pre-Amp (Amp 1) mounted on the primary stage, this IC contains the circuit for making the Amp 1 input voltage and the NF terminal voltage equipotential. Therefore, the offset voltage produced at the input stage is suppressed to prevent the pop noise at Vcc→ON. The capacity values of the input and NF condenser (C1 and C2) shall be set according to the gain to be used (Fig 4).

(Reference)  

(A) At Gv=50dB  (Rf=0Ω)  
C1=4.7μF,  C2=47μF

(B) At Gv=40dB  (Rf=470Ω)  
C1=3.3μF,  C2=33μF

![Diagram](image1)

![Diagram](image2)

\[ V_{OUT(DC)} \]

C1=3.3μF, C2=33μF

Fig.4
5. Muting Function

Through setting ① pin (mute terminal) at about 1V or less, muting becomes possible. The interval circuit of IC is shown in fig.4. When ① pin is set to LOW, Q1 and Q2 are turned to ON, the charge of the ripple condenser is discharged and the bias is cut. The mute amount of 60dB or over can be obtained.

Since this muting function rapidly discharge the charge of the ripple filter capacitor of ⑧ pin, the pop noise is generated by the DC fluctuation of the bias section. Therefore, this muting function is not appropriate to the audio muting but it is effective in muting at Vcc—ON.

![Fig. 5 Mute Circuit]

6. Rapid Ripple Discharging Circuit at the Time of VCC OFF

This circuit is effective in such a mode where the Vcc and the Stand--by terminals become high/low simultaneously; for instance, for pop noise produced when the power is turned ON/OFF repeatedly by operating the ignition key.

![Fig. 6]

If Vcc is OFF, Vcc ≈7V is detected internally on IC and
(1) The power stage bias circuit is cut, and
(2) ⑧ pin : Ripple capacitor is rapidly discharged by turning Q3 ON and then Q1 and Q2 ON.
(Precaution 1)
When the stand-by terminal was put to the low level after the ripple rapid discharging circuit was operated \( \text{VCC} \approx 7 \text{V} \) at the time when \( \text{VCC} \) was turned OFF, a pop noise may be generated. Therefore, \( \text{VCC} \) which makes the Stand-by terminal low shall be set at 8V or above so that (1) the Stand-by terminal is put at the low level and (2) the ripple rapid discharging circuit is turned ON when \( \text{VCC} \) is turned OFF (in order of (1) and (2)). An example of application is shown in (Fig. 7).

![Fig. 7]

(Precaution 2)
If the falling time constant of the \( \text{VCC} \) line is large (the fall is gentle), the pop noise may become worse.
In this case, it is possible to prevent the pop noise from becoming worse by reducing the capacity of \( \text{“Ripple rapid Discharging Circuit at the time of VCC OFF”} \) according to the following steps:
(a) Short Pin\( \overline{1} \) (Mute Terminal) and Pin\( \overline{8} \) (Ripple Terminal).
(b) Increase the capacity of ripple capacitor of Pin\( \overline{8} \).
However, it shall be kept in mind that the time for turning the power ON becomes longer as the result of step (b).
