45W BTL SINGLE AUDIO POWER AMPLIFIER

The KIA8225H is BTL audio power amplifier for consumer application.

It is designed for high power, low distortion and low noise. It contains various kind protectors and the function of stand--by SW.

In addition, the functions of output short or over voltage detection and junction temperature are involved.

**FEATURES**

- High Power
  - $P_{\text{OUT}(1)}=45W(\text{Typ})$
    - (Vcc=14.4V, f=1kHz, THD=10%, $R_L=2\Omega$)
  - $P_{\text{OUT}(2)}=40W(\text{Typ})$
    - (Vcc=13.2V, f=1kHz, THD=10%, $R_L=2\Omega$)
  - $P_{\text{OUT}(3)}=24W(\text{Typ})$
    - (Vcc=13.2V, f=1kHz, THD=10%, $R_L=4\Omega$)

- Low Thermal Resistance
  - $\theta_{J-C}=1.5^\circ\text{C}/\text{W}$ (Infinite Heat Sink)

- Excellent Output Power Band Width
  - $P_{\text{OUT(0)}}=18W(\text{Typ})$
    - (Vcc=13.2V, f=50Hz~20kHz, THD=1%, $R_L=4\Omega$)

- Low Distortion Ratio
  - THD:0.01% (Typ) Z
    - (Vcc=13.2V, f=1kHz, Pout=4W, $R_L=4\Omega$)

- Built-in stand-by function (With Pin2 set at high, power is turned ON)

- Built-in Output Short or Over Voltage Detection Circuit, Output to $V_{\text{CC}}$ and Output to GND Short. (Pin5: Open Collector)

- Built-in Junction Temperature Detection Circuit (Pin5: Open Collector)

- Built-in various protection circuit.
  - Thermal shut down, over voltage,
  - Output to GND Short
  - Output to $V_{\text{CC}}$ Short
  - Output to Output Short.

- Operating supply voltage: $V_{\text{CC(op)}}=9~18V$.

**MAXIMUM RATINGS (Ta=25^\circ\text{C})**

TEST CIRCUIT & BLOCK DIAGRAM

(Note) The purpose of RSBY is current limiting resistance.
CAUTION AND APPLICATION METHOD OF APPLICATION

1. Voltage gain adjustment
   Voltage gain $G_V$ of this IC is decided by the external feedback resistors $R_0$ and $R_6$.
   Gain fluctuation by temperature can be made smaller than they are housed in IC.
   Voltage gain $G_V$ is decided by the following expression:

   If $R_0=20k\Omega > R_0 > R_6$
   \[ G_V = 20 \log \frac{R_0 - R_6}{R_6} + 6(\text{dB}) \]

   If $R_0=20k\Omega > R_6 > R_0$
   \[ G_V = 20 \log \left( \frac{R_0}{R_6} + R_6 \right) + 6(\text{dB}) \]

   If $R_0$ and $R_6$ are made small, the following problems may be caused:
   1. When output short is released, output DC voltage is not restored.
   2. Fluctuation of output DC voltage by current I in (Fig. 1)
   If voltage gain is made small excessively, oscillation may be taken place and therefore, this IC shall be used at $G_V=34\text{dB}$ or above.

2. Preventive measure against oscillation
   For preventing the oscillation, it is advisable to use $C_4$, the condenser of polyester film having small characteristic fluctuation of the temperature and the frequency.
   The condenser ($Q_2$) between input and GND is effective for preventing oscillation which is generated with feedback signal from an output stage.
   The resistance $R$ to be series applied to $C_4$ is effective for phase correction of high frequency, and improves the oscillation allowance.
   Since the oscillation allowance is varied according to the causes described below, perform the temperature test to check the oscillation allowance.
   1. Voltage gain to be used ($G_V$ Setting)
   2. Capacity value of condenser
   3. Kind of condenser
   4. Layout of printed board
   In case of its use with the voltage gain $G_V$ reduced or with the feedback amount increased, care must be taken because the phase–inversion is caused by the high frequency resulting in making the oscillation liable generated.

3. Pop Noise
   A pop noise generated when the power source is turned ON depends on rise times of the in-phase side output ( Bipin) and the negative–phase side output offset voltage.
   The following two points may be pointed out as causes for generation the output offset voltage:
   1. In-phase and negative–phase NF capacitor charging time.
   2. Input offset voltage.
   Especially, the factor (2) relates to the pop noise level.
(1) In-phase and negative phase NF capacitor charging time

In (Fig.2.), when the power source is turned ON, Q1 and Q2 are turned ON, and NF capacitors are charged in the route of VCC→Q2→R→Boot→CBS→OUT→RO→CNF. For instance, if the capacity of an in-phase capacitor is not produced because a charging time of NF capacitor differs between the in-phase and negative-phase outputs. Therefore, to suppress the pop noise it is necessary to properly pair the in-phase and negative-phase NF capacitors. Output and NF DC voltage waveforms by the pairing of NF capacitors : C_{NF} are shown in (Fig.3) and (Fig.4).

Further, voltage waveforms are shown when the power source was turned ON, under the following conditions :

\[ V_{CC}=13.2V, \ \text{R}_{f}=4\Omega, \ \text{T}_{A}=25^\circ C, \ \text{and input shot-circuit.} \]

Output DC Voltage \( V_{OUT} \): (2V/div, 200ms/div)  
NF DC Voltage \( V_{NF} \): (1V/div, 200ms/div)

<td>(When ( C_{NF} ) are properly paired)</td>
</tr>
</tbody>
</table>

(Fig.3) (Fig.4)

(2) Input offset voltage

Input offset voltage is increased by as many times as a gain and appears as output offset voltage. Input offset voltage is affected by an external resistor in addition to properness of pair of Capacitor in IC.

An example of a general application circuit is shown in (Fig.5). In this case, input to the differential amplifier composing the buffer amplifier is decided to be 30k\( \Omega \)+1.1k\( \Omega =31.1k\Omega \) at the IN(+) side and 1.1k\( \Omega \) at the IN(−) side. Therefore a rising difference of about 30 times between the IN(+) side and the IN(−) side.

So, to fit input offset voltages, it is possible to suppress the input offset voltage by adjusting it to 31.1k\( \Omega \) both at the IN(+) and IN(−) sides according to the application example shown in (Fig.6). As input coupling capacitors are used in actual set, the circuit shown in (Fig.7) is considered. In this case, it is necessary to take the utmost care of proper pair of \( C_{IN}(+) \) and \( C_{IN}(-) \).

![Input Circuit](image)

(Fig.5) (Fig.6) (Fig.7)
4. Junction temperature detecting pin ②
Using temperature characteristic of a band gap circuit and in proportion to junction temperature, pin ② DC voltage \( V_2 \) rises at about ±10mV/°C temperature characteristic. So, the relation between \( V_2 \) at \( T_j = 25°C \) and \( V_{2x} \) at \( T_j = x°C \) is decided by the following expression:

\[
T(x°C) = \frac{V_{2x} - V_2(25°C)}{10mV/°C} + 25(°C)
\]

In deciding a heat sink size, a junction temperature can be easily made clear by measuring voltage at this pin while a backside temperature of IC was so far measured using a thermocouple type thermometer.

5. Output-VCC short, output-GND short and over voltage detecting pin ③
In case of such abnormalities as output-VCC short, output-GND short, overvoltage (Fig.9), it is possible to inform the abnormal state to the outside by turning a NPN transistor is turned ON.

It is possible to improve the reliability of not only power IC but also an entire equipment by (1) display by LED and LCD and (2) by turning the power supply relay off.

6. Stand-by SW function
By means of controlling pin ④ (Stand-by terminal) to High and Low, the power supply can be set to ON and OFF.
the threshold voltage of pin ④ is set at about \( 3V_{TH} \approx 2.1V \) (Typ.), and the power supply current is about 1μA (Typ.) at the stand-by state.

Control Voltage of ④ pin : \( V_{USB} \)

</tbody>
</table>

(Fig.11) with pin ④ set to high, power is turned ON.
<Caution>

Must be set the control voltage value less than VCC when the stand-by terminal (pin 1) is applied. In this case, we recommended the series connecting resistance for current limit: $R_{STBY}$ (100kΩ ~ 1kΩ to pin 1).

- Conventional Method -

- Stand-by Switch Method -
