2.3 W 2-Channel AF Power Amplifier for Radio Cassette Players

Features

- Built-in 2 channels enabling use in stereo and bridge amplifier (BTL) applications.
- High-output:
  - 2.3 W typ./channel, \( V_{CC} = 9 \text{ V}, R_L = 4 \Omega \)
  - 4.7 W typ./bridge amplifier, \( V_{CC} = 9 \text{ V}, R_L = 8 \Omega \)
- Low switching distortion at high frequencies.
- Minimum number of external parts required: 9 pcs. min. (Stereo/bridge).
- Small shock noise at the time of power supply ON/OFF due to built-in muting circuit.
- Good ripple rejection due to built-in ripple filter.
- Soft tone at the time of output saturation.
- Good channel separation.
- Voltage gain fixed at 45 dB (Bridge: 51 dB).
  Variable voltage gain available with external resistor added.

Package Dimensions

unit : mm

3022A-DIP12F

Note:
In general applications, heat generated in the DIP 12-pin package can be radiated through the Cu-foiled area of the printed circuit board, but since power dissipation \( P_d \) may be increased depending on the supply voltage and load conditions, it is recommended to use a fin additionally.

Pin Assignment and Equivalent Circuit
Sample Application Circuit 1: Stereo amplifier

Sample Application Circuit 2: Bridge amplifier

Example of printed circuit pattern (Cu-foiled area) for use in stereo, bridge amplifier applications

$60 \times 80 \text{ mm}^2$
### Description of External Parts

| C1 (C2)   | Feedback capacitor | The low-range cut-off frequency is determined by the following formula:  
|------------|---------------------|---------------------------------------------------------------------|
|            |                     | $f_L = \frac{1}{(2 \pi C1 Rf)}$, $f_L$: Low-range cut-off frequency  
|            |                     | $Rf$: Feedback resistor  
|            |                     | (50 $\Omega$ embedded + $Rf$ externally connected)  
|            |                     | The frequency, however, affects the starting time in conjunction with  
|            |                     | decoupling capacitors. Therefore, it is necessary to determine it after a 
|            |                     | full review of the required low-frequency range and other similar 
|            |                     | conditions.  
| C3 (C4)   | Bootstrap capacitor | The output at low frequencies depends on this capacitor. If the capacity 
|            |                     | is decreased, the output at low frequencies goes lower. 47 $\mu$F min. is 
|            |                     | required.  
| C5 (C6)   | Oscillation preventing capacitor | Use polyester film capacitor which is good in temperature characteristic 
|            |                     | and frequency characteristic. Aluminum electrolytic capacitor or 
|            |                     | ceramic capacitor causes oscillation at low temperatures.  
| C7 (C8)   | Output capacitor    | The low-range cut-off frequency is determined by the following formula.  
|            |                     | $f_L = \frac{1}{(2 \pi C7 R_L)}$, $f_L$: Low-range cut-off frequency  
|            |                     | $R_L$: Load resistance  
|            |                     | When using bridge-connected, double the capacitance to obtain 
|            |                     | equivalent low-range frequency characteristics to those in a 2-channel 
|            |                     | application.  
| C9        | Decoupling capacitor | Used for the ripple filter. Since the rejection effect is saturated at a 
|            |                     | certain capacity, it is meaningless to increase the capacity more than 
|            |                     | needed.  
|            |                     | This capacitor, being also used for the time constant of the muting 
|            |                     | circuit, affects the starting time.  
| C10       | Power source capacitor |  

### Application Circuits

1. Voltage gain adjustment
   
   * Stereo
     
     The voltage gain depends on built-in-resistors $R1$ ($R2$), $R3$ ($R4$) as follows:
     
     $$ VG = 20 \log \frac{R3 (R4)}{R1 (R2)} \ [dB] $$
     
     If the IC is used at a voltage gain less than this, the following equation with $Rf$ added applies:
     
     $$ VG = 20 \log \frac{R3 (R4)}{R1 (R2) + Rf} \ [dB] $$
     
     where $R1$ ($R2$) = 50 $\Omega$ typ.,  
     $R3$ ($R4$) = 10 k$\Omega$ typ.

   * Bridge
     
     The following shows the bridge amplifier configuration, where ch1 operates as a non-inverting amplifier and ch2 as an inverting amplifier.
The output of ch1 is divided with R5, R6 and led to pin 1 and then inputted to ch2. Since the attenuation degree (R5/R6) of ch1 output and the amplification degree (R4/R2 + R6) of ch2 are fixed at an equal value, the ch2 output is in opposite phase with the ch1 output. Therefore, the total voltage gain gets apparently 6 dB higher than the voltage gain of ch1 alone and is determined by the following equation.

\[ VG = 20 \log \left( \frac{R3}{R1} \right) + 6 \text{ [dB]} \]

If the IC is used at a voltage gain less than this, the following equation with Rf added applies.

\[ VG = 20 \log \left( \frac{R3}{R1 + Rf} \right) + 6 \text{ [dB]} \]

2. Starting time

Starting time depends on capacitance of C1 (C2) and C9 as shown in the diagram below. That is because of using a muting circuit utilizing the C9 (decoupling capacitor) time constant for pop noise prevention when power is turned on and charging circuits for C1 and C2 (NF capacitors).

3. Crosstalk

Channel separation characteristic is important for single-package IC embodying two channels. With LA4183, good channel separation is obtainable even as is, but if the BTL OUT pin (pin 1) is not grounded, it will invite imbalance in crosstalk between the two channels. (Refer to the characteristics diagram.)
Proper Cares in Operating a Set with LA4183 Incorporated

When a set with the LA4183 incorporated is operated from AC power supply, a momentary drop in supply voltage is caused by the transformer regulation, etc. at the time of turning ON the motor with the circuit shown below. In this case, if ripple noise is generated from the speaker or headphone, take the following actions.

1. Connect a diode (rectifier diode of average rectified current $I_0 = 100$ to 200 mA) across pins 6 and 12 of the LA4183 so that the voltage at pin 6 can follow the supply voltage regulation. In the steady state, this diode is cut off.
2. Increase the capacity of the power source capacitor so that the supply voltage regulation can be minimized.

![Circuit Diagram]

Radiation Design

* Since the DIP 12-pin package is so designed as to be able to radiate heat through the Cu-foiled area of printed circuit board under normal operating conditions, make the Cu-foiled area near the fin of IC as large as possible when designing the printed circuit board.
* By providing the Cu-foiled area covered by the broken line as shown in the above-mentioned example of printed circuit pattern, a rather satisfactory radiation is enabled. (Refer to the $P_d − T_a$ characteristics.)
* Since the power dissipation ($P_d$) goes higher depending on the conditions of supply voltage and load, it is recommended to use the fin together with the printed circuit board.
* The following equations are rule-of-thumb guides for $P_d$ (for stereo). For AC power supply, it is desirable to measure with the transformer of each individual set. In the bridge amplifier application, calculation should be made with 1/2 of the load used.

(1) DC Power supply

$$P_{d \ max} = \frac{V_{CC}^2}{\pi R_L} + I_{CCO} \cdot V_{CC} \ (\text{For stereo})$$

(2) AC power supply

$$P_{d \ max} = \frac{V_{CC} \cdot (P_d)^2}{\pi R_L} + I_{CCO} \cdot V_{CC} \ (P_d) \ (\text{For stereo})$$

$V_{CC}$: Quiescent supply voltage
$I_{CCO}$: Quiescent current
$V_{CC} \ (P_d)$: Supply voltage at $P_d$ max. output,

$$V_{CC} \ (P_d) = \frac{(1 + r) \cdot V_{CC1}}{1 + \frac{r \cdot V_{CC1}}{\sqrt{2} \cdot \pi \cdot R_L} \times \sqrt{\frac{R_L}{P_{O \ max}}}}$$

$V_{CC1}$: Supply voltage at max. output
$r$: Voltage regulation, $\frac{V_{CC2} - V_{CC1}}{V_{CC1}}$

Example of fin mounting

The fin is formed into such a shape as to be able to radiate heat from the plastic area of IC and the fin as shown below and is soldered to the printed circuit board. For the fin size, refer to the $P_d − T_a$ characteristics. The desirable material is copper or iron which is solderable. It is recommended to apply silicone grease, etc. to the plastic area of IC in order to minimize the thermal resistance.
IC Usage Notes

1. If the IC is used in the vicinity of the maximum rating, even a slight variation in conditions may cause the maximum rating to be exceeded, thereby leading to a breakdown. Allow an ample margin of variation for supply voltage, etc. and use the IC in the range where the maximum rating is not exceeded.

2. Pin-to-pin short
   If the supply voltage is applied when the space between pins is shorted, a breakdown or deterioration may occur. When installing the IC on the board or applying the supply voltage, make sure that the space between pins is not shorted with solder, etc.

3. Load short
   If the IC is used with the load shorted for a long time, a breakdown or deterioration will occur. Be sure not to short the load.

4. When the IC is used in radios or radio cassette tape recorders, keep a good distance between IC and bar antenna.

5. When making the board, refer to the example of printed circuit pattern.
